

CLAIMS

I claim:

1. A pill dispenser for holding pills, comprising:

a generally elongated body with a top end and a bottom end, that is hollow to accommodate a plurality of pills kept within the generally elongated body;

a bottom piece with a circumference, that forms a pencil tip and a knurled surface around the circumferential area of the bottom piece and is releasably attached to the bottom end of the generally elongated body;

a releasable cap that is removable from the top end of the generally elongated body to secure the plurality of pills within the generally elongated body;

a digital clockface that is housed within the releasable cap to indicate time;

a plurality of alarm components that are integral with the digital clockface and the alarm that is also housed within the releasable cap; and

a LCD light that indicates that the plurality of alarm components have been activated.

2. The pill dispenser according to claim 1, wherein the generally elongated body has a transparent window.

3. The pill dispenser according to claim 2, wherein the transparent window is attached to the generally elongated body by a hinge.

4. The pill dispenser according to claim 2, wherein the transparent window is attached to the generally elongated body by a snap mechanism.

5. The pill dispenser according to claim 1, wherein the functional bottom piece is a pen tip and a knurled surface.

6. The pill dispenser according to claim 1, wherein the functional bottom piece is a toothbrush head.

7. The pill dispenser according to claim 1, wherein the functional bottom piece is a hairbrush head.

8. The pill dispenser according to claim 1, wherein a securing clip is attached to the generally elongated body of the pill dispenser.
